AVELLINO, JOSEPH E

ART UNIT PAPER NUMBER

2143

DATE MAILED: 05/31/2005

Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary	Application No. 10/046,519	Applicant(s) GRAUPNER ET AL.	
	Examiner Joseph E. Avellino	Art Unit 2143	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 26 October 2001.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-18 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-18 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
 Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
 Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. Claims 1-18 are presented for examination; claims 1, 14, and 15 independent.

Double Patenting

2. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

3. Claims 1-31 of application no. 10/164,554 contain every element of claims 1-18 of the instant application and as such anticipate claims 1-18 of the instant application.

4. Claims 1-17 of application no. 10/046,516 contain every element of claims 1, 11, 13, and 14 of the instant application and as such anticipate claims 1, 11, 13, and 14 of the instant application.

5. Claims 1-15 of application no. 10/044,882 contain every element of claims 1-3, 5, 11, and 13-18 of the instant application and as such anticipate claims 1-3, 5, 11, and 13-18 of the instant application.

6. "A later patent claim is not patentably distinct from an earlier patent claim if the later claim is obvious over, or **anticipated by**, the earlier claim. In re Longi, 759 F.2d at 896, 225 USPQ at 651 (affirming a holding of obviousness-type double patenting because the claims at issue were obvious over claims in four prior art patents); In re Berg, 140 F.3d at 1437, 46 USPQ2d at 1233 (Fed. Cir. 1998) (affirming a holding of obviousness-type double patenting where a patent application claim to a genus is anticipated by a patent claim to a species within that genus)." ELI LILLY AND COMPANY v BARR LABORATORIES, INC., United States Court of Appeals for the Federal Circuit, ON PETITION FOR REHEARING EN BANC (DECIDED: May 30, 2001).

7. Claims 2-10, 14-18 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-17 of copending Application No. 10/046,516 (the '516 application).

'516 discloses the invention substantively as described in claim 1. '516 does not specifically disclose normalizing the attributes of the nodes, however it is well known that normalization of values is a simple statistical process that is done in order to obtain a base reference to interpret values resulting from heterogeneous entities. Therefore it would have been obvious to one of ordinary skill in the art to modify the teaching of '516

in order to include normalization of values in order to interpret values from different server and service nodes, and interpret these values in order to generate an optimized values taken with respect to their relationship with one another, thereby providing a more effective model of the service and server nodes.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

8. Claims 4, and 6-10 are provisionally rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claims 1-15 of copending Application No. 10/044,882 (the '882 application).

'882 discloses the invention substantively as described in claim 3. '882 does not disclose the optimization methods include a genetic process and a complete search process, however these processes are well known and are commonly utilized in optimization methods and would have been an obvious choice since they provide different algorithms of optimization in order to accomplish their goals. Therefore, it would have been obvious to one of ordinary skill in the art to modify the teaching of '882 to include a genetic process and a complete search process in order to provide the user with multiple optimization methods to provide an optimized mapping of the user selected service model to server nodes in a user-selected server model.

This is a provisional obviousness-type double patenting rejection because the conflicting claims have not in fact been patented.

Claim Rejections - 35 USC § 102

9. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1, 11, and 14 are rejected under 35 U.S.C. 102(e) as being anticipated by Pace et al. (US 2003/0051236) (hereinafter Pace).

10. Referring to claim 1, Pace discloses a computer-implemented method for optimizing allocation of computer resources, comprising

establishing a plurality of server models (i.e. target node classes), each server model including one or more server nodes (i.e. those which reflect geographic, logical, business category-based and or any other general class relationships), wherein each server node has an associated a set of capacity attributes (an inherent feature since every server has attributes regarding its capacity, and therefore every class of target nodes has an associated set of capacity attributes) (p. 19, ¶ 306);

establishing a plurality of service models (i.e. system parts classes), each service model including one or more service nodes (i.e. reflect technical requirement, business purpose or any other general class relationships), wherein each service node has an

associated a set of demand attributes (an inherent feature since metrics are returned p. 53 ¶ 808, which inherently requires that demands regarding the application must be there) (p. 19, ¶ 307);

selecting one of a plurality of user-selectable optimization methods (p. 53, ¶ 808-811);

generating an optimized mapping of service nodes in a user-selected service model to server nodes in a user-selected server model as a function of the demand and capacity attributes (the models are inherently user selected since the models must be created somehow based on characteristics stated in Pace, and therefore a network administrator would have to define those classes in some fashion) (p. 53, ¶ 808-811).

11. Referring to claim 11, Pace discloses selecting one of a plurality of user-selectable objective functions wherein the objective functions evaluates a solution as a function of the demand and capacity attributes; and generates an optimized mapping of the server nodes to the service nodes using the selected one of the objective functions and selected one of the optimization methods (p. 53, ¶ 808-811).

12. Claim 14 is rejected for similar reasons as stated above.

Claim Rejections - 35 USC § 103

13. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Art Unit: 2143

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

14. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 2-4, 6, 7, 12, 13, and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pace.

15. Referring to claim 2, Pace discloses the invention substantively as described in claim 1. Pace does not disclose normalizing the capacity attributes of server nodes and demand attributes of service nodes. However it is well known that normalization of values is a simple statistical process that is done in order to obtain a base reference to interpret values resulting from heterogeneous entities. Therefore it would have been obvious to one of ordinary skill in the art to modify the teaching of Pace in order to include normalization of values in order to interpret values from different server and service nodes, and interpret these values in order to generate an optimized values

Art Unit: 2143

taken with respect to their relationship with one another, thereby providing a more effective model of the service and server nodes and classes of nodes since Pace discloses that there are heterogeneous entities in the network (Figure 1G) which all contain different processing powers, it would be beneficial to one of ordinary skill in the art to correlate these values in order to get a baseline reference on which to interpret these attributes and metrics.

16. Claim 3 is rejected for similar reasons as stated above.

17. Referring to claim 4, Pace discloses the invention substantively as described in claim 3. Pace does not disclose the optimization methods include a genetic process and a complete search process, however these processes are well known in the art and their usage in optimization of computers and data, therefore it would have been obvious to one of ordinary skill in the art to modify the teaching of Pace to incorporate a genetic process and a complete search process to the optimization methods since Pace discloses a plurality of optimization methods (i.e. load balancing, migration, transport, QoS, etc.) (p. 53, ¶¶ 808-811), and furthermore state that these models are well known in the art. This would lead one of ordinary skill in the art to search for other optimization methods, eventually realizing the use of genetic processes and complete search processes in optimization.

Art Unit: 2143

18. Referring to claim 6, Pace discloses the plurality of objective functions includes a first function for quantifying a balance processing load between nodes and a second function quantifies a transport demand (i.e. QoS) between the nodes (p. 53, ¶ 808-825).

19. Claims 7, 12, 13, and 15 are rejected for similar reasons as stated above.

Claims 5, 8-10, and 16-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pace in view of Hauser et al. (USPN 5,889,956) (hereinafter Hauser).

20. Referring to claims 5 and 8, Pace discloses the invention substantively as described in claim 4. Pace furthermore inherently discloses establishing one or more service-node relationships between selected pairs of the service nodes, and establishing one or more server-node relationships between selected pairs of the server nodes, since any hierarchical relationship would have a reference to its parent and child level. Pace does not specifically disclose that the service-node relationships are demand attributes, the server-node relationships are capacity attributes, and generating an optimized mapping as a function of the service-node relationships and server-node relationships. In analogous art, Hauser discloses a hierarchical resource management system which discloses a service node model relationships (i.e. between the users of the programming department 22 and the engineering department 16) are demand attributes (i.e. a user of the lower level 22 requests resources of the system, which can be considered a demand attribute) (e.g. abstract; Figure 1). Hauser further discloses

Art Unit: 2143

the hierarchical resource management system can also have capacity attributes for the server nodes (i.e. the computers encompassed by the programming department 22 and the engineering department 16 since each level has an associated "Maximum_Allowed" value which determines the capacity of the resource for the department) (e.g. abstract). Hauser furthermore discloses generating an optimized mapping as a function of the service node relationships and server node relationships (if a user has not met his "minimum_guaranteed" value of resource, the system is optimized and extra capacity is taken from another department, 18 for example, and applied to the user, thereby providing an optimization between the service relationships and the server relationships). It would have been obvious to one of ordinary skill in the art to combine the teaching of Hauser with Pace since Pace discloses that load balancing models are well known in the art, this would motivate one of ordinary skill in the art for other methods of hierarchical resource management, eventually finding Hauser and its use of Maximum allowed values, and minimum guaranteed values (e.g. abstract).

21. Referring to claims 9 and 10, Hauser in view of Pace disclose the invention substantively as described in claim 7. Pace does not disclose the service node has a set of capacity attributes and optimizing mapping between the capacity attributes of the two levels. Hauser discloses that when a lower level 22 demands use of a resource, the higher level 16 checks to make sure it is below its "maximum allowed" level, thereby inherently having a capacity attribute (e.g. abstract; col. 3, line 66 to col. 4, line 19). Furthermore Hauser discloses that a lower level resource can demand more from a

Art Unit: 2143

higher level such that it does not meet its "minimum guaranteed" value (e.g. abstract; col. 4, lines 20-40). When these teachings are applied to both the service-model nodes as well as the server-model nodes, they teach the limitations of the aforementioned claims. It would have been obvious to one of ordinary skill in the art to combine the teaching of Hauser with Pace since Pace discloses that load balancing models are well known in the art, this would motivate one of ordinary skill in the art for other methods of hierarchical resource management, eventually finding Hauser and its use of Maximum allowed values, and minimum guaranteed values (e.g. abstract).

22. Claims 16-18 are rejected for similar reasons as stated above.

Conclusion

23. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Joseph E. Avellino whose telephone number is (571) 272-3905. The examiner can normally be reached on Monday-Friday 7:00-4:00.

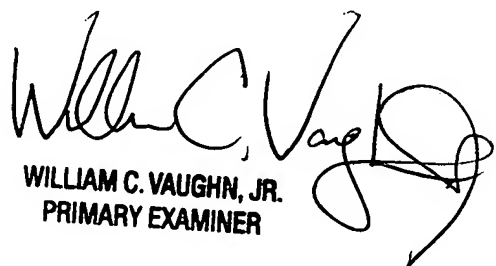

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David A. Wiley can be reached on (571) 272-3923. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
